Branding

1. Branding Hierarchy in a Multi-Tenant System

There should be **two branding layers**.

Platform Branding (Super Admin)

Controlled by your company.

This defines:

- default UI layout
- default theme
- login page structure
- email templates
- report templates

Example:

```
Platform: RynatySpace SMS
Default theme: blue
Default font: Inter
```

Tenant Branding (School)

Each tenant can customize their appearance.

Example:

```
Tenant: Greenfield Academy
Logo: greenfield_logo.png
Primary Color: green
Font: Poppins
```

This customization overrides platform defaults.

---

2. Where Tenant Branding Settings Should Exist

Inside **Tenant Settings**.

Structure:

```
Tenant Admin
   Settings
      ├ School Profile
      ├ Branding & Theme
      ├ System Preferences
      ├ Communication
      └ Security
```

Branding page:

```
Settings
   └ Branding & Theme
```

---

3. What Tenant Branding Should Control

Identity

- school logo
- school emblem
- favicon
- school name display format

Colors

Allow **3 main theme colors**.

```
Primary color
Secondary color
Accent color
```

Example:

```
Primary: #006400
Secondary: #f5f5f5
Accent: #ff9900
```

These colors apply to:

- buttons
- menus
- headers
- charts

Typography

Allow tenants to select a font from predefined list.

Example fonts:

- Inter
- Poppins
- Roboto
- Open Sans
- Lato

Avoid custom uploads for performance.

Login Page Branding

Tenant can customize:

- login logo
- login background image
- welcome text

Example:

```
Welcome to Greenfield Academy Portal
```

Report Branding

This is **very important for schools**.

Reports must include:

- school logo
- school address

- school colors
- footer signature

Used in:

- report cards
- invoices
- transcripts
- attendance reports
- certificates

---

4. Branding Data Structure

Create a table:

```
tenant_branding
```

Fields:

```
tenant_id
logo_url
favicon_url
primary_color
secondary_color
accent_color
font_family
login_background
report_header_logo
report_footer_text
email_signature
updated_at
```

---

5. How Branding Propagates Across the System

When a user logs in, system loads:

```
TenantBranding
```

Apply globally.

Example process:

```
User login
    ↓
Load tenant
    ↓
Fetch tenant branding
    ↓
Apply theme variables
```

---

6. Frontend Implementation (Theme Variables)

Use CSS variables.

Example:

```
:root {
 --primary-color: #1a73e8;
 --secondary-color: #f1f3f4;
 --accent-color: #ff9900;
 --font-family: "Inter";
}
```

When tenant changes theme:

```
:root {
 --primary-color: #006400;
 --secondary-color: #e6ffe6;
}
```

All UI updates instantly.

---

7. Branding in Reports (PDF / Export)

Reports must dynamically use tenant branding.

Example header:

```
[School Logo]

Greenfield Academy
P.O Box 1200 Nairobi
Phone: +254700000000
```

Footer:

```
Generated by Greenfield Academy SMS
```

PDF generation pulls branding:

```
TenantBranding.logo
TenantBranding.primary_color
```

---

8. Branding in Emails

Example email:

```
From: Greenfield Academy

[Logo]

Dear Parent,
Your child’s report card is ready.
```

Email theme uses:

- logo
- primary color
- school name

---

9. Branding in Mobile/Parent Portal

Parent portal should also load tenant branding.

Example:

```
parent.greenfield.edu
```

Portal shows:

- school logo
- theme colors
- school name

---

10. Branding in Downloads

Files generated by system must use tenant identity.

Examples:

Report Card

```
Logo
School name
School address
School colors
```

Invoice

```
Logo
School name
School contact
School theme
```

Transcript

```
School emblem
Signature section
Official header
```

---

11. Branding Restrictions (Important)

To keep UI clean:

Tenants **should not control**:

- page layout
- module structure
- UI components
- dashboard layout

Only control:

```
logo
colors
fonts
images
```

---

12. Theme Presets (Recommended)

Provide presets for easy selection.

Example:

```
Classic
Modern
Dark
Light
School Blue
Education Green
```

Tenants can then tweak colors.

---

13. Branding Preview

Add **live preview** before saving.

Example interface:

```
Select color
Upload logo
Choose font

Preview Dashboard
Preview Report
Preview Email
```

---

14. Default Fallback System

If tenant does not configure branding:

System uses platform defaults.

Example:

```
Default logo
Default colors
Default font
```

---

15. Advanced Feature (Future)

Allow schools to customize:

Certificates

Examples:

- graduation certificate
- achievement award
- participation certificate

Using their branding.

---

16. Super Tenant Controls

Super admin should also control:

```
max logo size
allowed fonts
image formats
```

Example:

```
Logo max size: 2MB
Formats: PNG SVG
```

---

17. File Storage for Branding Assets

Brand assets stored in:

```
/tenants/{tenant_id}/branding/
```

Example:

```
/tenants/greenfield/logo.png
/tenants/greenfield/login-bg.jpg
```

---

18. Best UX for Branding Page

Layout example:

```
Branding & Theme
----------------------------

School Logo
[Upload]

Favicon
[Upload]

Primary Color
[Color Picker]

Secondary Color
[Color Picker]

Accent Color
[Color Picker]

Font
[Dropdown]

Login Background
[Upload]

Report Header Logo
[Upload]

Email Signature
[Editor]

[Preview] [Save]
```

---

19. Branding Security

Only these roles can edit branding:

Role	Access
Tenant Admin	Full
System Admin	Full
Other users	No

---

20. Final Architecture

```
Platform Default Branding
         ↓
```

```
Tenant Branding Settings
         ↓
Frontend Theme Engine
         ↓
Reports & Export Engine
         ↓
Email Templates
         ↓
Parent Portal
```

Everything pulls from **TenantBranding**.
