# 1. Real-World Student Transfer Process (How Schools Actually Do It)

In most countries, the process looks like this:

### Step 1 — Parent Requests Transfer

Parent/guardian informs **current school (School A)** they want to move the student.

Reasons include:

- relocation
- change of school
- disciplinary issues
- academic preference
- financial reasons

### Step 2 — School A Reviews Student Record

School checks:

- outstanding **fees**
- **disciplinary issues**
- **clearance forms**
- library clearance
- transport clearance
- academic record completeness

### Step 3 — School A Issues Transfer Documents

Usually includes:

- Transfer letter
- Student academic transcript
- Conduct report
- Immunization/health record
- Birth certificate copy
- Admission number

### Step 4 — Parent Applies to New School (School B)

School B reviews:

- academic performance
- conduct
- class capacity
- entrance interview/test

### Step 5 — School B Accepts or Rejects

If accepted:

- student receives **new admission number**
- student data is **re-entered or imported**

Important:

**Schools rarely give full internal records to other schools.**

Only **necessary information is shared**.

---

# 2. How This Should Work in a Multi-Tenant SaaS

Each school = **tenant**

So transferring means:

```
Tenant A  →  Tenant B
```

But tenants **cannot automatically access each other's databases**.

So the transfer system should use a **secure transfer request workflow**.

Architecture:

```
Parent → Tenant A
Tenant A → Transfer Request → Tenant B
Tenant B → Accept / Reject
```

---

# 3. Can the Parent Module Request Transfer Directly?

Yes — but **not automatically executed**.

Parents can only **initiate the request**.

Flow:

```
Parent Portal
    ↓
Request Transfer
    ↓
School A Review
    ↓
Send Transfer Package
    ↓
School B Review
    ↓
Accept / Reject
```

Parent should **not control the transfer**.

They only submit:

- reason
- destination school
- preferred class
- relocation info

# 4. What Information the Parent Can Provide

In the **Parent Module**, they can provide:

### Transfer Request Form

Fields:

Student:

- student ID
- full name

Transfer details:

- destination school
- reason for transfer
- preferred grade/class
- preferred start term

Additional info:

- relocation address
- supporting documents
- medical updates

Parent cannot modify:

- academic records
- disciplinary records
- financial records

---

# 5. Which Module Handles Transfers

Transfers should belong to:

## Admissions / Enrollment Module

Submodule:

```
Admissions
   └── Student Transfers
```

Users allowed to manage transfers:

| Role | Permission |
|---|---|
| Tenant Admin | Full |
| Registrar / Admissions Officer | Full |
| Academic Admin | View |
| Teacher | View |
| Parent | Request only |

---

# 6. Discipline Records (Suspension, Expulsion, Warnings)

These belong to the **Behavior / Discipline module**.

Submodule:

```
Students Module
   └── Behavior / Discipline
```

Types:

## Warning

Minor misconduct.

Examples:

- late arrival
- uniform violation

## Suspension

Temporary removal.

Example:

- bullying
- cheating

## Expulsion

Permanent removal from school.

Example:

- violence
- drug possession

---

# 7. How Discipline Affects Transfers

This is extremely important.

Schools may include:

| Record | Shared with new school |
|---|---|
| Academic transcript | YES |
| Health records | YES |
| Basic discipline summary | SOMETIMES |
| Full disciplinary records | NO |
| Internal investigations | NO |

Better practice:

Provide **discipline summary**:

```
Behavior Rating:
Good / Average / Poor
```

Or:

```
Major incidents: 2
Minor incidents: 4
```

Do not send:

- teacher notes
- confidential reports

---

# 8. What Data Can Be Shared Between Tenants

Safe minimal dataset:

### Student Identity

- first name
- last name
- DOB
- gender
- nationality

### Academic Data

- previous grade
- last academic year
- transcript
- exam summary

### Health Data

- allergies
- immunization
- medical alerts

### Guardian Info

- parent names
- phone
- email
- emergency contact

### Enrollment Data

- previous school name
- transfer reason
- clearance status

---

# 9. Data That Should NOT Be Shared

Never automatically transfer:

- internal staff notes
- disciplinary investigation files
- financial ledgers
- unpaid invoices
- teacher comments
- internal risk flags

Instead share:

```
Financial clearance: YES / NO
```

---

# 10. How Transfer Requests Between Tenants Work

### Tenant A → Tenant B

1 Parent requests transfer
2 Admissions officer reviews
3 School generates transfer package
4 System sends **Transfer Request**

```
POST /api/transfers/request/
```

Payload:

```
{
  student_id,
  destination_tenant,
  transfer_reason,
  academic_summary,
  health_summary,
  guardian_contacts
}
```

Status:

```
Pending
Accepted
Rejected
Cancelled
Completed
```

---

### Tenant B Workflow

Admissions officer reviews:

- academic level
- discipline summary
- available class space

Actions:

```
Accept
Reject
Request More Info
Schedule Interview
```

---

# 11. What Happens When Transfer Is Accepted

System does NOT move the student record.

Instead:

### Tenant B creates NEW student record

with imported data.

Example:

Tenant A ID:

```
A-STU-324
```

Tenant B new ID:

```
B-STU-901
```

But store reference:

```
previous_school_id
transfer_reference_id
```

---

# 12. Internal Tenant Transfer (Within Same School)

Example:

```
Class A → Class B
Campus 1 → Campus 2
```

This is **Enrollment Module**.

No cross-tenant workflow needed.

---

# 13. Notifications

Transfer workflow should trigger notifications.

### Parent

- transfer request submitted
- transfer approved
- transfer rejected

### School A

- request submitted
- clearance pending
- transfer completed

### School B

- new transfer request
- student accepted
- more info needed

Channels:

- email
- SMS
- WhatsApp
- in-app notification

Your system already supports messaging through **communication module**.

---

# 14. Transfer Lifecycle (Complete)

```
Parent submits request
        ↓
Tenant A reviews
        ↓
Clearance checks
        ↓
Transfer package created
        ↓
Request sent to Tenant B
        ↓
Tenant B reviews
        ↓
Accept / Reject
        ↓
Student enrolled in Tenant B
        ↓
Tenant A marks student as transferred
```

---

# 15. Database Structure Recommendation

Transfer table:

```
StudentTransfer
```

Fields:

```
id
student_id
source_tenant
destination_tenant
request_date
status
transfer_reason
discipline_summary
academic_summary
health_summary
clearance_status
accepted_date
completed_date
```

---

# 16. Best UX for Your SaaS

Parent portal:

```
Student
   └── Request Transfer
```

Admissions module:

```
Admissions
   └── Transfer Requests
        ├ Pending
        ├ Accepted
        ├ Rejected
```

---

# 17. Security Rule (VERY IMPORTANT)

Tenants **must never directly query another tenant database**.

Always use:

```
Transfer API
```

or

```
Transfer package export/import
```

---

# 18. One Advanced Feature (Future)

Allow **verified school network transfers**.

Example:

Schools using your platform can transfer students instantly.

```
School A → School B
```

But still require **approval workflow**.
